

K2 capacity versus selecting its useful corrections

POST-HOC DIAGNOSTIC · frozen outputs · 3 exposed scenes × 4 ROI

Arithmetic MSE-gain differences	Native	-3 mm	+3 mm
Pool → K2 capacity gap (pp)	19.73	27.97	29.92
K2 oracle → actual selection gap (pp)	127.84	38.80	40.71

Both oracle series use evaluation-reference selection; actual K2 does not. Zero marks identity; negative means damage.

Pool and K2 candidate sets are not nested: their gap is descriptive, not an isolated causal compression estimate.
